No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   involving NF-kappaB in a cell may be achieved by modulating the activity of II-1RAcp using binding agents such as agonists and antagonists. Hybridisation probes to the cDNA sequence can be used to identify wild-type and mutant II-1RacP alleles in clinical and laboratory samples. Mutant alleles are used to generate allele-specific oligonucleotide (ASO) probes for high-throughput clinical diagnoses of diseases or disorders with an inflammatory response. In therapy, therapeutic II-1RacP nucleic acids are used to modulate cellular expression or intracellular concentration or availability of active II-1RacP. This invention also comprises a method of screening for an agent that modulates the interaction of an interleukin receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the human interleukin-1 receptor accessory protein (IL-IRacP) cDNA of the invention. The interleukin receptor accessory protein (IL-IRacP) and its modulators (agonists) are useful for regulating cell function. Transient expression of either IL-IRI or IL-IRacP alone does not result in ligand-independent induction of an NF-kappaB dependent luciferase reporter gene in 293 cells, however coexpression of both proteins resulted in a 20-fold increase in activation of NF-kappaB activity to a level comparable to that induced by IL-1. These data suggest that aggregation of IL-IRI and IL-IRACP as a result of protein overexpression can elicit a signaling pathway leading to NF-kappaB activation. Modulation of signal transduction in the continuous activation of signal transduction is a cell of the continuous activation of signal transduction is continuous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1740 BP; 518 A; 360 C; 411 G; 451 T; 0 other;

It was obtd. from a human YT cell cDNA library using a probe derived from a human partial genomic clone. The cDNA can be used for the prodn. of pure IL-1R AcP by expression in a host cell. The IL-1R AcP is used to treat or prevent the

It was obtd. by PCR amplification (see also AAT32029-30) of cDNA (AAT32026) coding for extracellular domain of IL-1R AcP (AAW01911). The soluble protein was expressed in Sf9 insect cells using a baculovirus system. It can be used to treat or prevent the inflammatory or immunological activities of IL-1, and also to screen for IL-1 antagonists.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
This sequence encodes fusion polypeptide 569, which is capable of binding cytokine IL-1 to form a non-functional complex. The invention concerns production of antagonists to any cytokine that utilizes an alpha specificity determining component, which when combined with the cytokine; binds to a first beta signal transducing component to form a non-functional intermediate which then binds to a second beta signal transducing component causing beta-receptor dimerization, the soluble alpha specificity determining component of the receptor (sR-alpha) and the extracellular domain of the first beta signal transducing component of the cytokine by binding the cytokine to form heterodimers (sR-alpha:beta-1) that act as antagonist to the cytokine by binding the cytokien to form a non-functional complex. The receptor components are shared by cytokines such as the CNTF (ciliary)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAA09048 standard; DNA; 2733

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               neurotrophic factor) family of cytokines. The invention provides the basis for the development of IL-6 antagonists, as they show that if, in the presence of a ligand, a non-functional intermediate complex, consisting of the ligand, its alpha recepotr and its beta-1 receptor component, can be formed, it will effectively block the action of the ligand. Effective antagonists of IL-6 or CNFF consist of heterodimers of the extracellular domains of the alpha specificity determining components of their receptors and the extracellular domain of gpl30. The resultant heterodimers, function as high-affinity traps, rendering the cytokine inaccessible to form a signal transducing complex with the native membrane-bound forms of their receptor. The nucleic acids and polypeptides are useful for treating cytokine-related diseases or disorders such as osteoporosis and primary and secondary effects of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
A cDNA clone (AAT32028) codes for mouse interleukin-1 receptor accessory protein (II-IR AcP), a protein that inhibits the ability of II-1 to bind to, or otherwise activate, the II-IR, esp. the Type 1 II-IR. It was obtd. by screening cell-surface proteins in COS-7 cells transfected by 3T3-II cDNA using anti-murine II-IR ACP monoclonal antibody 4C5, and isolation of cDNA clones from positive lines. The murine cDNA was used to obtain a partial genomic clone of the human homologue. A probe derived from this genomic clone was then used to isolate the full-length cDNA (AAT32026) for human II-IR AcP (AAW01911).
                                                                                                                                                                                                                                                                                                                                                                                              mat_peptide

CC coexpression of both proteins resulted in a 20-fold increase in a cativation of NF-kappaB activity to a level comparable to that induced by IL-1. These data suggest that aggregation of IL-IRI and IL-IR AcP as CC a result of protein overexpression can elicit a signaling pathway CC leading to NF-kappaB activation. Modulating signal transduction CC involving NF-kappaB in a cell may be achieved by modulating the activity CC of IL-IRAcp using binding agents such as agonists and antagonists. CC Hybridisation probes to the CDNA sequence can be used to identify wild-CC type and mutant IL-IR AcP alleles in clinical and laboratory camples. Mutant alleles are used to generate allele-specific CC oligonucleotide (ASO) probes for high-throughput clinical diagnoses CC of diseases or disorders with an inflammatory response. In therapy, therapeutic IL-IRAcp nucleic acids are used to modulate cellular expression or intracellular concentration or availability of cative IL-IR AcP. This invention also comprises a method of screening for a part that the content also comprises a method of screening for a contive IL-IR AcP. The interleukin receptor accessory protein (IL-IR AcP) and its modulators (agonists/antagonists) are useful for regulating cell function. Transient expression of either IL-IRI or IL-IRAcP alone does not result in ligand-independent induction of an NF-kappaB-dependent luciferase reporter gene in 293 cells, however the property of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2001-595441/67

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
This cDNA clone codes for human interleukin-1 receptor accessory

molecule (IL1-R AcM) (see AAW33897), a new member of the

immunoglobulin superfamily that forms a complex with type 1 IL1-R

and which has higher affinity for IL-1 than the receptor itself,

suggesting that the known high and low affinity forms of IL1-R are

in fact the receptor with or without IL1-R AcM, respectively.

The 2155 bp sequence is present in clone HMEBIS2 (deposited as

C ATCC 97666) derived from microvascular epithelium (no details of

isolation given). Recombinant expression in Escherichia coli,

mammalian and insect cells is described. Recombinant host cells

and recombinant vectors are claimed. Also claimed are isolated

nucleic acid molecules encoding epitope-bearing portions (see

AAW5398-9.15) of IL1-R AcM. Recombinant I1-R AcM can be used to

identify IL-IR agonists and antagonists useful for therapeutic

modulation of IL1-B acM, antagonists useful for trarapeutic

Nucleic acid fragments are useful as diagnostic probes and primers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Interleukin-1 receptor accessory molecule; IL-1R AcM; human; signal transduction; infection; septic shock; inflammation; rheumatoid arthritis; therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1635

                               The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printe specification, but was obtained in electronic format, directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1203

                                                                                                                                                         The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

                       expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene
                                                                                                                                                                                               Claim
                                                                                                                                                                                                                          Human genome-derived single exon nucleic acid probes useful analyzing gene expression in human cervical epithelial cells
                                                                                                                                                                                                                                                                         WPI; 2001-488901/53.

                                                                                                         The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                04-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                           ireating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic transplantation, cardiovascular diseases, diabetes mellitus, systemic manufacture beneficially hyperparative diabetes mellitus, systemic
                                                                                                                                                                                                                   The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Tab) in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-MAY-2000;

This sequence encodes a interleukin-1 (II-1) receptor-like polypeptide, designated II-1 receptor DNAX designation 8 (II--IRDB), of the invention. The II-IRDB, II-IRDB, and II-IRDD proteins, their fragments and muteins, also related antibodies, other binding agents and (ant) agonists are used to treat conditions associated with abnormal expression of the polypeptide or abnormal expression of, or response to, their ligands, e.g. immunological, inflammatory or morphological disorders. They may also be used to screen for binding agents (potential drugs), diagnostic reagents (to detect the proteins or their ligands) and to isolate related sequences. Antibodies may also be used to raise anti-idiotypic antibodies, as carriers for toxins, radiomuclides or other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mammalian physiology such as morphogenesis of immune system function. The invention particularly relates to nucleic acids, proteins and antibodies which regulate development and/or the immune system. The invention also relates to antibody fragments which specifically bind to antigenic fragments of a primate interleukin (IL)-1 receptor like molecules such as IL-1 receptor DNAX designation (IL-IRD). The antibody fragments of the invention are useful to treat conditions exhibiting abnormal expression of the receptors or their ligands which typically will be immunological disorders. The present sequence is a DNA encoding

                                                                                                                                                                                                                                                   RX PX PX SX FX DX PX AX
                                                                                                                                                                                                                                                                         nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label developed from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for centrying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The Drister sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                               Best Local Similarity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  id. No. is the number of results predicted by chance to have a
ore greater than or equal to the score of the result being printed,
it is derived by analysis of the total score distribution.
